FAQ

Q1: How often should I inspect my upright boom lift?

A1: You should conduct a thorough pre-operational inspection before each use. In addition to pre-use inspections, a more comprehensive inspection should be performed at regular intervals, as specified in the manufacturer's manual (this might be daily, weekly, or monthly depending on usage frequency).

Q2: What are the common causes of hydraulic leaks?

A2: Hydraulic leaks are usually caused by damaged hoses, loose fittings, or worn seals. High pressure within the hydraulic system can also cause leaks over time if components are weakened. Regular visual inspections and pressure testing can help identify and address potential problems before they become serious.

Q3: How do I choose the right upright boom lift for my needs?

A3: Consider factors like working height, load capacity, and the space available for maneuvering the lift. It's best to consult with a supplier specializing in lifting equipment to ensure you select a model that meets your specific requirements. Factors like indoor vs. outdoor use and terrain will also influence your selection.
