Understanding Dialectical Behavior Therapy (DBT)

Dialectical Behavior Therapy is a type of cognitive-behavioral therapy (CBT) specifically designed to treat individuals with borderline personality disorder (BPD) and other related conditions characterized by emotional dysregulation, impulsive

behaviors, and interpersonal difficulties. DBT emphasizes the importance of accepting oneself while simultaneously striving for change. This "dialectic" – the integration of acceptance and change – forms the core principle of the therapy. It's a holistic approach, recognizing that mental health issues are complex and require multifaceted interventions.
